

1. National Forest: Toiyabe National Forest
2. Stream: Morgan Creek
3. Authority: Organic Administration Act of 1897
4. Priority Date: April 15, 1907
5. Purpose: To secure favorable conditions of water flows.
6. Location of Primary Quantification Point:
 - a. General: At the Forest boundary.
 - b. Legal: SE1/4 NE1/4, Section 23, T.12N., R.47E., MDM (unsurveyed), or at a point from which the SE corner Section 36, T.12N., R.47E., bears S24° 30'E at a distance of 15,900 feet.
7. Instream Flow Claim - Primary Point: A continuous instream flow equivalent to an average of 276 acre-feet per year (primary instream flow volume) at the primary point of quantification described in paragraph 6 above, defined and distributed as follows:
 - a. During the period of annual snowmelt runoff. When the spring runoff hydrograph reaches bankfull discharge, and equals or exceeds that amount for 24 hours, but in no event earlier than May 23, a flow of 3.9 cubic feet per second for a period of 18 days.
 - b. At all other times. A baseflow discharge of 0.2 cubic feet per second.
8. Instream Flow Claim - Supplemental Points. A continuous instream flow on Morgan Creek and its named and unnamed tributaries calculated as follows:
 - a. Supplemental Minimum Instream Flow Volume: Calculate 34.6% of the total annual yield (acre-feet) attributable to the drainage area above the supplemental point.
 - b. Supplemental Minimum Instream Flow Rate: Multiply the flow rates in paragraphs 7a and 7b by the supplemental flow volume computed in paragraph 8a above and divide by the primary instream flow volume in paragraph 7.
9. In the event that natural flows do not attain the rates decreed above, the United States shall be entitled to the natural flow actually occurring during the time periods described in paragraphs 7a and 7b.

R.M. "JIM" NELSON, Forest Supervisor
