6. LITHOLOGIC LOG

Material	Water Strata	From	To	Thick-ness
The well was T-V videoed to 307'				
A rig was set up to try and bail out material in bottom. A hard bottom was achieved at 318'				
Hole was ten perforated from 200-300', 8 holes around every 12 inches in height. The well was then surged, with pea gravel material surging into the well. There was a great amount of drill mud bailed from the hole. Barafoss chemicals were placed in the perforation areas and surged into well. After chemical action they were bailed out of hole. A Bail test was run for one hour to determine water volumn, and was found possible for the well to possibly make 15-20 GPM.
